## FL SWITCH SFN ...

## Five and Eight Port Standard Function Ethernet Switches with Narrow Housings Gigabit as an Option

## AUTOMATIONWORX

Data Sheet

© PHOENIX CONTACT - 07/2007

## Description

The FL SWITCH SFN ... range of Factory Line switches with standard functions in numerous versions can be used for quick and cost-effective Ethernet network expansion to the field level. Due to their narrow housing design, the components are suitable for universal remote use in control cabinets and junction boxes. The switches have five or eight ports, up to two of which are glass fiber ports provided in SC or ST format. The switches support the auto negotiation function at the twisted pair ports and offer transmission speeds of 10/100/1000 Mbps depending on the switch version. Mixed operation for the connection of segments with different data transmission speeds is also supported. The glass fiber ports only support 100 Mbps or 1000 Mbps (Gigabit version).

The RJ45 ports offer an auto crossing function, which means it is not necessary to make a distinction between 1:1 and crossover cables.

The fiber optic ports can be used to extend the segment length up to 20 km . Unused RJ45 ports can be fitted with security caps to provide mechanical protection against unauthorized use.

## Features and Fields of Application

- Increased network performance
- Switched Ethernet reduces traffic and non predictable timing
- Quality of Service: Pretagged high priority messages are forwarded before lower priority messages during periods of high network traffic loading
- Gigabit options for data intensive applications
- Easy network expansion
- No configuration of the switch
- Autonegotiation and autocross simplify cabeling
- Coupling copper network segments with different bit rates with automatic detection of the data transmission speed of $10 \mathrm{Mbps}, 100 \mathrm{Mbps}$ or 1000 Mbps depending on the switch version.
- Fiber optic options extend distance and electrical noise immunity
- 1 or 2 ports option
- SC or ST connector options
- Multimode or singlemode option

Low cost, low complexity security (optional)

- Connect Layer 1 security elements at the RJ45 port to restrict access or tampering
- No software setup needed

Please note the different connection directions of the transmission media for five-port switches: copper cables are connected at the front, glass fiber cables at the bottom.

## Differences Compared to Previous Versions

## Version 00 - First version

Version 01 - Update Gigabit, supply voltage, current consumption, surge and approvals
Version 02 - Update 1000 Mbit/s multimode

## Housing Versions and Position of the Fiber Optic Connections

## 5 Port Versions

The housings of the 5 -port versions are identical. Port 5 is located at the bottom.

Figure 1 Housing example for 5-port switches

## FL SWITCH SFN ...

## 8 Port Versions

The housings of the 8-port versions are identical. On the fiber optic versions, the connections for the fiber optic ports are at the front. The physical location of the ports on the 10/100 and 10/100/1000 (Gigabit) switches are the same.

Figure 2 Housing example for 8-port switches
Local Diagnostic and Status Indicators for 10/100 or 10/100/1000 Mbps Versions

| Des. | Color | Status | Meaning |
| :---: | :---: | :---: | :--- |
| US | Green | ON | Supply voltage US in the tolerance range |
| or <br> US1/2 |  | OFF | Supply voltage US too low |

LEDs on 10/100 Mbps Versions for the Data Transmission Speed (2 LEDs/Port)

|  | 10 Mbps | 100 Mbps |
| :---: | :---: | :---: |
| LNK/ACT | ON/blinking | ON/blinking |
| $\mathbf{1 0 0}$ | OFF | ON |

LNK/ACT LED:
ON: indicates an electrical Link
Blinking: indicates network traffic (at high data rates the blinking is in a constant rate)

LEDs on 10/100/1000 Mbps Versions for the Data Transmission Speed (2 LEDs/Port)

|  | 10 Mbps | 100 Mbps | 1000 Mbps |
| :---: | :---: | :---: | :---: |
| 100/ACT | ON/blinking | ON/blinking | OFF |
| 1000/ACT | ON/blinking | OFF | ON/blinking |

One LED/port ON or blinking:
ON: indicates an electrical Link
Blinking: indicates network traffic at the data rate (x Mbit/s)

Both LEDs/port ON or blinking:
Both ON: indicates a $10 \mathrm{Mbit} / \mathrm{s}$ electrical Link
Both Blinking: indicates $10 \mathrm{Mbit} / \mathrm{s}$ network traffic

## General Information

## Warning

Disregarding this warning may result in damage to equipment and/or serious personal injury. Only qualified personnel may start up and operate these devices. According to the safety instructions in this text, qualified personnel are persons who are authorized to start up, to ground, and to mark devices, systems, and equipment according to the standards of safety technology. In addition, these persons must be familiar with all warning instructions and maintenance measures in this text.

## Warning

The FL SWITCH SFN ... module is designed exclusively for SELV operation according to IEC 950/EN 60950/VDE 0805.

## Using the FL SEC PAC Kit for Port Security

Layer 1 Port security for up to 4 ports, is provided by purchasing the FL SEC PAC kit. The kit contains 4 red security frames, 4 grey port blocking security caps, unlocking key and instructions. The red security frame must first be attached to each port that is to be secured.

- First orient the red security frame, so that the cable locking tabs of both the frame and the switch are aligned.
- Then, insert the 4 mounting feet of the security frame into the pre-punched holes around the switch port and push until the frame snaps into place with an audible click.

Once attached, the security frames are permanently mounted and can not be removed.

Inserted cables or grey port blocking security caps will now be locked into place. Instructions for using the key to unlock the cables or security caps are included in the kit.

## FL SWITCH SFN ...

## Installation and Assembly/Removal

Install the FL SWITCH SFN ... on a clean DIN rail. To avoid contact resistance only use clean, corrosion-free DIN rails. End clamps can be mounted on both sides of the module to stop the modules from slipping on the DIN rail.

Connect the DIN rail to protective earth ground using a grounding terminal block. The modules are grounded when they are snapped onto the DIN rail. Connect protective earth ground with low impedance. Gigabit components have a functional earth ground connecting screw on the top.

## Assembly:

1. Place the module onto the DIN rail from above. The upper holding keyway must be hooked onto the top edge of the DIN rail.
2. Push the module from the front towards the mounting surface.

## Removal:

1. Insert a suitable tool (e.g., needle-nose pliers) into the arresting latch and pull it down.
2. Pull the module slightly away from the mounting surface.

## Terminal Assignment for 10/100 Mbps Versions

Figure 3 Terminal assignment

## Terminal Assignment for 10/100/1000 Mbps Versions

| Terminal | Meaning |
| :---: | :--- |
| $\mathbf{1}$ | Supply voltage +US 1 |
| $\mathbf{2}$ | GND US 1 |
| $\mathbf{3}$ | Supply voltage +US 2 |
| $\mathbf{4}$ | GND US 2 |
| $\mathbf{5}$ | Alarm contact R1 |
| $\mathbf{6}$ | Alarm contact R2 |

Figure 4 Terminal assignment

## Supply Voltage Connection and Grounding for 10/100 Mbps Versions

## Supply Voltage

The switch is designed for SELV operation at +24 V DC according to IEC 950/EN 60950/VDE 0805. Only SELV according to the defined standards may be used for supply purposes.

## Connection to Functional Earth Ground

Snapping the switch onto a grounded DIN rail connects it to the ground potential. In an environment particularly prone to EMI, noise immunity can be increased by an additional low-impedance connection to functional earth ground via terminal 3 or 4 .

Figure 5 Example for supply of a 10/100 Mbps module

## Supply Voltage Connection and Grounding for 10/100/1000 Mbps Versions

## Supply Voltage

The switch is designed for SELV operation at 24 V DC according to IEC 950/EN 60950/VDE 0805. Only SELV according to the defined standards may be used for supply purposes.

Operate the module using a +24 V DC SELV. The module is fully operational even with only one supply voltage (without jumpering it to other supply voltage terminal blocks) and/or without wiring the alarm contact (see Figure 6, A).

Figure 6 Supply of a 10/100/1000 Mbps module from one or two voltage sources

## Alarm Contact Operation

- One or more power supplies failed -> the contact clos-
es
- Power OK -> the contact opens

The maximum current, include inrush, is 100 mA .

## Connection to Functional Earth Ground

Snapping the switch onto a grounded DIN rail connects it to the ground potential. In an environment particularly prone to EMI, the switch can be grounded by an additional low-im-
pedance connection to functional earth ground via an eyelet ring on the upper part of the housing.

Figure 7 Grounding via an eyelet ring

## Ethernet Interface

The FL SWITCH SFN ... has up to 8 Ethernet ports on the front in RJ45 format, to which only twisted pair cables with an impedance of $100 \Omega$ can be connected. The data transmission speed is $10 \mathrm{Mbps} / 100 \mathrm{Mbps}$ or $10 \mathrm{Mbps} / 100 \mathrm{Mbps} / 1000 \mathrm{Mbps}$. In addition, every port has an auto crossing function: it is not necessary to make a distinction between 1:1 or crossover Ethernet cables.

10/100/1000 Mbps

Figure 8 Pin assignment of the Ethernet ports in RJ45 format

## Switching Characteristics of the FL SWITCH SFN ...

- Store and Forward

All data telegrams that are received by the switch are saved and their validity checked. Invalid or faulty data packets (> 1522 bytes or CRC errors) and fragments (< 64 bytes) are rejected. Valid data telegrams are forwarded by the switch. The switch always forwards the data using the data transmission speed that is used in the destination network segment.

- Multi-Address Function

The switch independently learns the addresses for termination devices, which are connected via a port, by evaluating the source addresses in the data telegrams. Only packets with unknown addresses, with a source address of this port or with a multicast/broadcast address in the destination address field are forwarded via
the corresponding port. The switch can store addresses in its address table with an aging time of 5 minutes. This is important when more than one termination device is connected to one or more ports. In this way, several independent subnetworks can be connected to one switch.

- Quality of Service (QoS): IEEE 802.1P/Q

The SFN switches are capable of reading Ethernet packets that have already been assignent a priority level by a managed switch or other. In cases of heavy traffic, packets with a priority 4-7 are considered high priority and processed before packets with 0-3 priority level. After prioritization the packets are forwarded without modification.

A restart deletes the entire address table.

## Housing Dimensions

Figure 9 Housing dimensions for the FL SWITCH SFN ...
The housing depth is 70 mm for all housing versions.
